TECHNOLOGY APPLICATION CENTER
THE UNIVERSITY OF NEW MEXICO
ALBUQUERQUE, NEW MEXICO 87131

The Technology Application Center (TAC) is one of six NASA-sponsored, nonprofit, regional centers for the transfer of technology to industry, local government, and the private sector in general. Through TAC, access to most of the world's available technical information is conveniently and inexpensively provided to potential users, regardless of their size or technical interest area.

Through its professional staff, TAC offers a wide variety of technical information and technological support services.

You are invited to contact the center directly for details and a discussion of how we can further serve your needs.

INTRODUCTION

This is the fourth quarterly update for 1977 in Heat Pipe Technology.

The major portion of this quarter's activity has been in the area of heat pipe applications for energy conservation and solar energy related systems. An increased number of publications in the areas of electrical and electronic applications of heat pipes also appear in this issue.

The bibliography has undergone some revision, with section IIB now entitled Energy Conversion and Power Systems, and section IIC now entitled Energy Conservation, Solar, Nuclear and other Energy Systems. These new sections result from our effort to maintain the bibliography within today's categories of interest, and to encompass the trend which heat pipe technology is currently setting.

We would also like to inform our subscribers that the bibliography is now being compiled utilizing an increased amount of computerized literature searching with the most prominent and complete engineering and science data bases being accessed.

We at TAC hope that our efforts are helping to make this a more complete and reader responsive publication, and we would appreciate comments or suggestions which would contribute to this effort.

Gilbert A. Rivera
Technical Editor

GUIDE TO USE OF THIS PUBLICATION

A number of features have been incorporated to help the reader use this document. They consist of:

- A TABLE OF CONTENTS listing general categories of subject content and indexes. More specific coverage by subject title/keyword and author is available through the appropriate index.
- CITATION NUMBERS assigned to each reference. These numbers, with the prefix omitted, are used instead of page numbers to identify references in the various indexes. They are also used as TAC identifier numbers when dealing with document orders; so please use the entire (prefix included) citation number when corresponding with TAC regarding a reference. An open ended numbering system facilitates easy incorporation of subsequent updates into the organization of the material. In this system, numbers assigned to new citations in each category will follow directly the last assigned numbers in the previous publication. The citation number of the last reference on each page appears on the upper right-hand corner of that page to facilitate quick location of a specific term.
- A REFERENCE FORMAT containing the TAC citation number, title of reference, author, corporate affiliation, reference source, contract or grant number, abstract and keywords. The reference source tells, to the best of our knowledge, where the reference came from. If from a periodical, the reference source contains the periodical's title, volume number, page number and date. If for a report, the reference source contains the report number assigned by the issuing agency, number of pages and date.

- An INDEX OF AUTHORS alphabetized by author's last name. A reference's author is followed by the reference's citation number. For multiple authors, each author is listed in the index.
- An INDEX OF PERMUTED TITLES/KEYWORDS affords access through major words in the title and through an assigned set of keywords for each citation. A reference's title is followed by the reference's citation number. In the indexes, all the words pertaining to a reference are permuted alphabetically. Thus, the citation number for a reference appears as many times as there are major title words or keywords for that reference. The permuted words run down the center of an index page. The rest of the title or keywords appear adjacent to a permuted word. Since a title or set of keywords is allowed only one line per permuted word the beginning, the end, or both ends of a title or set of keywords may be cut off; or, if space permits, it will be continued at the opposite side of the page until it runs back into itself. A # indicates the end of a title or set of keywords while a / indicates where a title or set of keywords has been cut off within a line.

I. GENERAL INFORMATION, REVIEWS, SURVEYS

HP77 10006 REQUIREMENTS FOR U.S. HEAT PIPE EXPERIMENTS ON SPACELAB TEST FACILITY - Final Report

Almgren, D.W., (Arthur D. Little, Inc., Cambridge, MA), May-Oct 1976, (Contract NAS5-23391), Sponsored by Goddard Space Flight Center, Greenbelt, MD
 Avail:TAC

ESA is planning to supply a heat pipe test facility as part of the first Spacelab mission, scheduled to be launched in the third quarter of CY 1980. Mr. S. Ollendorf of NASA GSFC has submitted a proposal to NASA Headquarters in which, as Principal Investigator, he will provide heat pipes from the United States to be tested on the European facility. This report contains the ideas and opinions of the U.S. heat pipe investigators who responded to NASA's request for suggestions for experiments to be performed on Spacelab I. The suggested program goals and organization were developed during informal interviews with the potential experimenters. Based on all of the information gathered, a candidate grouping of experiments has been suggested for the initial flight that would permit five of the twenty-six suggested experiment ideas to be tested.

(PROPOSAL, PROGRAM GOALS, POTENTIAL EXPERIMENTS)

HP77 10007 10TH INTERSOCIETY ENERGY CONVERSION ENGINEERING CONFERENCE

(Newark, DE), (New York, NY), IEEE, Aug 18-22, 1975

The following topics were considered: Electrochemical Cells; LMFBR; Energy Storage; Solar Heating and Cooling; Nuclear Power System; Thermionic Energy Conversion; Photovoltaic Conversion; Topping Cycles; Unique Engines; Solar Power; Synthetic Liquid Fuels; Thermoelectric Systems; Isotope Power Systems; Wind Power; Biomedical Power; H₂ Space Power System; Heat Pipe Followed by Brayton Cycle Systems. 249 papers were presented.

(ENERGY CONVERSION, THERMODYNAMICS, OVER-VIEW)

HP77 10008 HEAT AND MASS TRANSFER BIBLIOGRAPHY-SOVIET WORKS

Luikov, A.V., Int. J. Heat and Mass Transfer, (GB), V 18:697-705, N5

This bibliography of Soviet Works covers the following: Thermodynamics; Thermophysical Transport; Hydromechanics; Forced Convection; Natural Convection; Capillary-Porous Bodies; Phase Conversions; Radiation; Combined Heat and Mass Transfer; Rheophysics; Heat Pipes; Heat and Mass Transfer.

(REVIEWS, HEAT TRANSFER, FLUID FLOW, THERMODYNAMICS)

HP77 10009 THERMAL CONTROL BY HEAT PIPES

Oshima, K., (Soc. of Instrument and Control Engrs., Tokyo, Japan), J. Soc. Instrum. and Control Eng., Japan, V 14:662-670, N9
 No abstract available

(REVIEW, THERMAL CONTROL)

HP77 10010 HEAT EXCHANGERS

Schmidt, E.L., Eisenmann, G., Hahne, E., (Inst. Fur Thermodynamik and Warmtech. Univ. Stuttgart, Stuttgart, Germany), Brennst.-Waerme-Kraft, (BWK), Germany, V 28:169-171, N4

Literature survey dealing with heat exchangers, including: Augmented Convective Heat Flow, Radiative Heat Transfer at High Temperature, Design Calculations Techniques, Heat Pipe Porous Heat-Exchanger Technology, Heat Recovery Schemes, Regenerators, Materials, Operating Experience and Optimisation of Cooler/System Matching.

(REVIEWS, HEAT EXCHANGERS, HEAT TRANSFER)

HP77 10011 ANNUAL REVIEWS

Van Dyke, M., Vincenti, G., Annual Review of Fluid Mechanics, Palo Alto, CA, V 7

A collection of review papers on the following: Fluid Mechanics, Delft University; Turbulent Boundary Layers; Nonlinear Thermal Convection; Relaxation Methods in Fluid Mechanics; Granular Flow; Flow Lasers; Vortices; Heat Pipes; Oceanic Waste-Water Disposal; Navier-Stokes Equations; Rotating and Stratified Flow; Turbulence; Large Lake Hydrodynamics; Wave Effect on Rubble-Mound Structures.

(REVIEW, THERMODYNAMICS, HEAT TRANSFER, FLUID FLOW)

HP77 10012 ALASKA PIPELINE SPINOFFS

Weismantel, G.E., Chem. Eng., NY, V 81:42-44, N6, Mar 18, 1974
No abstract available

(TRANSPORT, ENGINEERING, MARKET)

II. HEAT PIPE APPLICATIONS

II. A. GENERAL APPLICATIONS

HP77 20032 WETTING BY SODIUM AT HIGH TEMPERATURES IN PURE VAPOUR ATMOSPHERE

Bader, M., Busse, C.A., (EURATOM-JRC, Ispra (Va.), Italy), Journal of Nuclear Materials, V 67:295-300, Feb 1977
 Avail:TAC

The wetting angle of sodium on different pure metals (Ni, Ta, Nb, Mo, W), alloys (stainless steel 304L, Inconel 600, RTG36, TZM) and oxides (Feldmühle E37, Degussa AL23, sapphire, ZrO_2 , Y_2O_3) was measured in the temperature range from 520 to 720°C. A new measurement method was applied consisting of a combination of the classical sessile drop with a gas controlled heat pipe. The method is especially suited for high temperatures where the previous methods are impracticable because of excessive sodium evaporation. In the temperature range mentioned all investigated materials are wetted. The maximum measured wetting angle is 7.5°C. The wetting angles are nearly independent from temperature, but they show a time-dependency consisting in general of a rapid initial decrease and a reaching of the equilibrium value after about 1 hour.

(GAS CONTROLLED HEAT-PIPE, WETTING ANGLE, METALS, SESSILE DROP, TESTING)

HP77 20033 PREPARATION OF VAPOR GROWN LEAD-TIN TELLURIDE FOR 8-14 MICROMETER PHOTO-DIODES

Bradford, A., Wentworth, E., (Night Vision Lab., Fort Belvoir, VA), Infrared Phys., (GB), V 15:303-309, N4, A76-22930

Single crystals of lead-tin telluride ($Pb_{0.8}Sn_{0.2}Te$) 19 mm in diameter and up to 25 mm long have been grown by a closed-tube seeded vapor transport method. The crystals were grown in furnaces equipped with isothermal 'heat pipes' which provide convenient control of the temperature profile during growth. Growth rates of 2-2.5 g/day were utilized. Scanning x-ray topography analysis revealed good crystallinity. Wafers cut from the crystals were annealed to a carrier concentration $1-2 \cdot 10^{17} \text{ cm}^{-3}$ and mobilities of $2-3 \cdot 10^4 \text{ cm}^2/\text{v-sec}$ (p-type, 77K). Photodiodes formed from this material had peak detectivities of $2 \cdot 10^{10} \text{ cm Hz}^{-1} \text{ W}^{-1}$.

(HEAT PIPE FURNACE, SEMICONDUCTOR GROWTH, TEMPERATURE CONTROL)

HP77 20034 REALISATION OF A MONOMODE LASER IN A HEAT PIPE OVEN ON THE LAMDA#1.5 MUM LINE OF BARIUM

Cahuzac, P., Drago, X., (Lab. AIME Cotton, CNRS II, Orsay, France), Opt. Commun., Netherlands, V 18:600-602, N4, A77-003570
 Avail:TAC

The article describes the properties of laser effect observed in a vapor provided in a heat pipe oven. The oscillation is pulsed and occurs on the barium line at 1.5 mum. with pulse duration of 20 ns.

(HEAT-PIPE OVEN, GAS LASERS)

HP77 20035 INTERCALIBRATION OF TEMPERATURE TRANSDUCER WITH A HEAT PIPE FURNACE. TEMPERATURE MEASUREMENT, 1975. TEDDINGTON, MIDDX. LONDON, ENGLAND

Coville, P., Laurencier, A., Billing, B.F., Quinn, T.J., (Soc. Anonyme D'Etudes et Realisations Nucleaires, Sodern, Suresnes, France), A76-07490
 Avail:TAC

A heat pipe furnace is described in which channels are provided to accommodate a number of thermocouples or resistance thermometers for comparison. These channels are isothermal, and temperatures are constant over several hours. The temperature reached by the system when heated from room temperature is always the same within a few tenths of a degree centigrade without reference to another temperature transducer. This property is compared to the fixed point obtained by freezing of pure metals or compounds.

(HEAT-PIPE FURNACE, CALIBRATION, ISOTHERMAL, TEMPERATURE TRANSDUCER)

HP77 20036 'THERMAL CONDUCTION PIPE' AND ITS APPLICATIONS

Elektronik Germany, V 24:101-102, N11
 Avail:TAC

The principle of the heat pipe is described consisting of a sealed copper tube stainless steel or special glass, evacuated and containing a small amount of a special liquid; the inner wall is coated with a porous material, which acts as a wick. When one end is heated, the liquid boils, its vapour condenses at the cold end and is conducted back by the capillary porous layer, thus operating a heat transfer. The pipe is not a cooling element but a thermal conductor, of use in semiconductor heat sink applications. Several designs of tubular, flat and ribbed devices are described. Of particular interest is the isothermal oven 'Calocoax' by Philips, which consists of two coaxial, welded-together heat pipes, with a metal gauze capillary lining and an additional heater filament. The oven is intended for diffusion processes in semiconductor manufacture and is set apart by its uniform and closely controlled temperature.

(HEAT SINKS, ISOTHERMAL OVEN, SEMICONDUCTORS)

HP77 20037 ANALYSIS OF A HIGH-HEAT-FLUX WATER HEAT PIPE EVAPORATOR - Technical Report

Feldman, K.T., Jr., Berger, M.E.

Avail:TAC

No abstract available

(COMPUTER PROGRAM, NUMERICAL ANALYSIS, HEAT EXCHANGERS)

HP77 20038 LASER PHOTOLUMINESCENCE OF Bi₂

Gerber, G., Sakurai, K., Broida, H.P., (Dept. of Phys. Univ. of California, Santa Barbara, CA), J. Chem. Phys., V 64:3410-3422, N8, A76-60899

Avail:TAC

A heat-pipe oven has been used to produce molecular bismuth. Strong luminescence has its origin in various vibrational-rotational transitions of the A-X system. It is suggested that A is not the first excited state and that X does not represent the ground state. Spectra are also presented using white light. Both line and continuum spectra are reported.

(HEAT-PIPE OVEN, PHOTOLUMINESCENCE, LINE SPECTRA, INERT GAS-FLOW)

HP77 20039 LINE-TERMINAL CONSTRUCTION TO BE COMPLETED BY MID-YEAR

Ives, G., Jr., Pipe Line Ind., V 46:31-33, N1, Jan 1977

Avail:TAC

Alaska Pipeline Service Co. reports the final section of the 1287-km (800-mile) Trans-Alaska Pipeline was laid last month in rugged Thompson Pass, 32.1 km (20 mi.) northeast of the Valdez Terminal. The pass is only 88 km (55 mi.) north of the Tonsina River, where the first sections of pipe were installed March 27, 1975. Even though all sections of the pipeline are in place, not all are connected by welds. Overall, the project is 91 percent complete and the pipeline itself is 97 percent complete. Start-up for the project is targeted for early summer. Interestingly, the project presented a number of firsts in pipeline construction. For example, the Trans-Alaska Line was the first to: use an internal weld inspection and repair vehicle; use a special refrigerant burial system; use a microwave network, as well as a satellite earth system; have sections constructed in an insulated box; utilize a cableway in construction; have primary pump stations enclosed in buildings; and have an above-ground pipeline system employing thermal devices to remove heat from the ground and use airborne infrared to monitor the heat pipe system.

(ALYESKA, PERMA-FROST, AIRBORNE-INFRARED-MONITOR)

HP77 20040 APPLICATIONS OF HEAT PIPES

Kikuchi, K., Arisawa, K., Yuwata, Z., Matsumoto, K., (Furukawa Electric Co. Ltd., Tokyo, Japan), Furukawa Electr. Rev., Japan, p. 67-80, N56, B76-15887

Avail:TAC

Explains the principles, working limits, working modes, etc. of the heat pipes superconductors of heat. Also introduced are some examples of the practical use of the tube, centering on its application in NASA's space development, and for cooling of large-capacity semi-conducting elements.

(HEAT SINK, APPLICATIONS, OVERVIEW)

HP77 20041 CURRENT ACTIVITY IN APPLIANCE DESIGN

Kirk, W.B., (American Gas Association Labs., Cleveland, OH), Institute of Gas Technology, Chicago, IL, 1974, Proceedings of the Third Conference on Natural Gas Research and Technology.

Avail:TAC

Factors affecting the design of more efficient appliances are presented, followed by a brief synopsis of recent and new projects aimed at conserving energy. Examples of concepts for achieving higher efficiencies are reviewed.

(CONSERVATION, HEAT PUMPS, FURNACES, REFRIGERATION, STOVES)

HP77 20042 GENERAL SUMMARY OF EFFICIENT USE OF FUELS IN PROCESS AND MANUFACTURING INDUSTRIES

Long, G.M., (Inst. of Gas Tech., Chicago, IL), 1974
Avail:TAC

April 16 to 19, 1974, the Institute of Gas Technology held a symposium in Chicago on efficient use of fuels in the process and manufacturing industries. Increased efficiency has been necessitated by price increases, which, in part, have resulted from curtailments or interruptions of fuel supplies. Measures to attain more efficient fuel utilization are thus prompted by availability as well as price considerations. Some 30 speakers, singly and in panels, discussed the theme from the standpoints of fuel and price forecasts, economics, conservation, trade-association actions, monitoring of energy usage, controls, insulation, boilers, improved combustion, heat pipes, heat-storage wells, infrared heating, waste-heat recovery, alternative combustible gases, industry experience, fuel allocations, and government research. A general summary of the symposium as delivered by the symposium chairman in closing the conference is presented.

(CONSERVATION, INDUSTRIAL PLANTS, HEAT RECOVERY, ECONOMICS)

HP77 20043 THE HEAT PIPE COOLING SYSTEM FOR THE BRAKE EXCITATION CONVERTOR OF ELECTRIC LOCOMOTIVES

Lossel, W., Fries, P., Ruger, H., Elektr. Bahnen, Germany, V 46:33-36, N2, B75-18351
Avail:TAC

The heat pipe as a means of conveying and dispersing heat, is much smaller and lighter than the usual radiator; for example, to disperse the equivalent of 0.5 kW to 1.0 kW in heat loss, a heat pipe would weigh some 4 kg against 20 kg for the usual radiator. Tests are currently being conducted by the German Railways on locomotive convertors fitted with heat pipe cooling arrays.

(POWER CONVERTERS, COOLING, BRAKING)

HP77 20044 HEAT-PIPE-OVEN REACTOR (HPOR) STUDIES. II. FORMATION OF EXCITED CN IN THE Li-NF₃-CCl₄ TERNARY FLAME SYSTEM

Luria, M., Eckstrom, D.J., Benson, S.W., (Phys. Sci. Div., Stanford Res. Inst., Menlo Park, CA), J. Chem. Phys., V 65:1595-1596, N4, A76-88148
Avail:TAC

First observations of purely chemically produced electronically excited CN molecules from the NF₃-CCl₄-Li Ternary Flame System is reported. The reaction is studied in a heat pipe oven reactor, the light output in the range 2000 to 8000 Angstroms' being recorded. The composition of the emission spectrum is outlined and major features identified. Possible excitation mechanisms for production of excited CN molecules are discussed.

(SPECTRA, TERNARY FLAME, EXCITED MOLECULES)

HP77 20045 LASER PHOTOLUMINESCENCE OF CALCIUM MOLECULES

Sakurai, K., Broida, H.P., (Dept. of Phys. Univ. of California, Santa Barbara, CA), J. Chem. Phys., V 65:1138-1145, N3, A76-83032
Avail:TAC

A variety of laser lines have been utilized to excite photoluminescence spectra of Ca₂. The calcium was produced in diatomic form using a heat pipe oven, in the temperature range from 1000 to 1200°K. A number of the spectra are reproduced and their characteristics catalogued with sharp lines identified and associated with the known bound states of calcium. Characteristics of the spectra indicate the effects of dissociation of excited molecules, emissions to repulsive parts of lower states and bound states.

(PHOTOLUMINESCENCE, HEAT-PIPE OVEN, SPECTRA)

HP77 20046 CHEMILUMINESCENCE OF CaH AND AlH IN THE REACTION OF THE METAL ATOMS AND FORMALDEHYDE

Sakurai, I., Adams, A., Broida, H.P., (Quantum Inst. and Phys. Dept. Univ. of California, Santa Barbara, CA), Chem. Phys. Lett., Netherlands, V 39:442-444, N3, A76-62685

Avail:TAC

Chemiluminescence from the reaction of calcium and aluminum with various hydrogen containing compounds in a flowing gas in a heat pipe oven are described. Red chemiluminescence of CaH was observed in the reaction of calcium, and weak chemiluminescence of AlH was seen in the reaction of aluminum with formaldehyde (H₂CO). It is proposed that a reaction between metal atoms and formaldehyde may be used as a source of diatomic metallic hydrides.

(HEAT-PIPE OVEN, FLOWING GAS SYSTEM, BOND ENERGY)

HP77 20047 TESTING STATIC SEALS AT HIGHER TEMPERATURES IN REAL CONDITIONS BY MEANS OF HEAT-PIPE TECHNIQUES

Verheyden, L.J., Schins, H.E., Kerntechnik, V 16:23-24, N1, Jan 1974

Avail:TAC

A method is described for testing global leaktightness of seals in a small and not expensive test rig based on the heat pipe principle, in which it is possible to create thermal shocks in both directions and to make long term tests. Two examples of applications are described with all details. In conclusion the advantages and disadvantages of the method are summarized.

(LEAKTIGHT TEST, TEST EQUIPMENT, THERMAL SHOCK)

HP77 20048 ARCTIC TUNDRA KEPT FROZEN BY HEAT PIPES

Waters, E.D., Oil Gas J., V 72:122-125, Aug 26, 1974

Avail:TAC

Alaska Pipeline Service Co. has awarded McDonnell Douglas Corp. a \$13 million contract to build nearly 100,000 heat pipes for the Trans-Alaska Pipeline. The heat pipes are cryo-anchor soil stabilizers (see gas abstr. 29,73-0686) designed to prevent thawing of permafrost around pipe supports for elevated portions of the line. These passive soil-refrigeration devices utilize an anhydrous ammonia process, with no moving parts or external power. Advantages include low overall cost, ease of installation, high reliability, versatility, adaptability to various supports, recoverability at end of short-term projects, prevention of gradual degradation and irrevocable losses of land and structures, and the possibility of retrofitting to correct developing problems.

(ALYESKA, PERMAFROST, CRYO-ANCHOR, SOIL STABILIZER)

HP77 20049 PIPELINES AND ACCESSORIES FOR DISTRIBUTION NETWORKS OF DISTRICT HEATING. PLANNING, CONSTRUCTION, CALCULATION

Ziegler, K., Eisenhauer, G., (VWEW, Frankfurt Am Main, F.R. Germany), 1974, In German
A short survey of the field of district heating engineering is presented.

(SURVEY, OVERVIEW, ENGINEERING)

II. B. ENERGY CONVERSION AND POWER SYSTEMS

HP77 21003 IMPROVING FUEL VAPORIZATION

Automot. Eng., NY, V 84:37-43, N6, June 1976

Avail:TAC

The application of a heat pipe to the fuel system of an automobile engine is discussed. The improvement in uniformity of the air-fuel charge in each cylinder will result in smooth engine operation on lean mixtures, lower exhaust emissions, and improved fuel economy. The design and operation of the vaporizing pipe are given, and some performance test data are presented.

(AUTOMOBILES, FUEL SYSTEMS, EVAPORATION, GASOLINE)

HP77 21004 THERMOELECTRIC POWER SYSTEM

Byrd, A.W.

Avail:TAC

A thermoelectric power system comprised of a heat source having a fluid inlet and outlet for receiving fluid at the inlet, heating the fluid, and providing it as a heated fluid at the said outlet. Each thermoelectric generator assembly is comprised of a fluid chamber, first and second heat pipes, a mounting device, a thermoelectric element radiation unit coupled to the second heat pipe, and a pumping device.

(THERMOELECTRIC, POWER GENERATION, POWER SYSTEM)

HP77 21005 COMPARISON OF HYDROGEN WITH ALTERNATE ENERGY FORMS FROM COAL AND NUCLEAR ENERGY

Cox, K.E., (New Mexico Univ., Albuquerque, NM, Dept. of Nuclear Engineering), Energy Convers., V 6:49-54, N1-2, 1976

Avail:TAC

Alternate energy forms that can be produced from coal and nuclear energy have been analyzed on efficiency, economic and end-use grounds. These forms include hydrogen, methane, electricity, and Eva-Adam, a 'chemical heat pipe' approach to energy transmission. The Eva-Adam system for nuclear heat appears to be economically competitive with the other energy carriers except over very large distances. The cost of hydrogen derived from coal is approximately equal to that of methane derived from the same source when compared on an equal Btu basis. Thermochemically derived hydrogen from nuclear energy shows a break-even range with hydrogen derived from coal at coal costs of from 33 to 80/English pounds per ton depending on the cost of nuclear heat. Electricity and electrolytically derived hydrogen are the most expensive energy carriers and electricity's use should be limited to applications involving work rather than heat. Continued work in thermochemical hydrogen production schemes should be supported as an energy option for the future.

(ENERGY CONVERSION, GASIFICATION, HYDROGEN, METHANE, ECONOMICS)

HP77 21006 HEAT PIPES FOR USE IN HIGH-BTU GASIFICATION OF COAL

Gillmore, D.W., Strimbeck, D.C., (U.S. Dept. of Interior, Bureau of Mines, Morgantown Energy Research Center, Morgantown, WV), 1971-1976, U.S. Dept. of Interior, Bureau of Mines

Avail:TAC

Evaluation of the Principle of using heat pipes to transfer heat to a fluidized-bed coal gasifier.

(COAL GASIFICATION, FUEL GAS)

HP77 21007 A TEST OF FUSIBLE INSULATION FOR A PROPOSED ISOTOPE POWER UNIT

Lackey, M.E., (Oak Ridge National Laboratory, Oak Ridge, TN), 78 p., 6 refs, Apr 1974, 2 figures, ORNL-TM-4422

Avail:TAC

In support of the isotope kilowatt program, evaluation tests of the full-scale simulated thermoelectric power generation system was made. The test was run with 6.5 in. of fusible insulation around the heat block-shield to determine the system heat losses. A test was run to determine the thermal coupling between the heat block-shield and 12 heat pipes with 12 simulated thermoelectric generators. A loss-of-coolant accident test was made to determine the maximum fuel capsule surface temperature reached during a meltdown of the fusible insulation.

(THERMOELECTRIC, POWER GENERATION, INSULATION, ISOTOPIC GENERATOR)

HP77 21008 ENERGY TRANSMISSION SYSTEMS

Leeth, G.G., (General Electric Co., Santa Barbara, CA), Int. J. Hydrogen Energy, V 1: 49-53, N1, 1976

Avail:TAC

Various methods of transporting large quantities of energy are compared. The energy source is assumed to be nuclear fission. However, expected significant effects of alternative energy sources are noted. The associated energy distribution system is essentially ignored. The procedure consists of evaluating several different thermal, chemical, and electrical energy forms. Basically, the evaluation is a technical and economic comparison including capital costs and energy loss costs. Additional qualitative evaluation is accomplished by listing significant features of the various energy modes. Results indicate that hydrogen is superior to all forms of energy transport considered. An Eva-Adam system is intermediate between hydrogen and electricity or hot

water. High-voltage electric overhead transmission and hot water are the most expensive systems. In addition, for the case of a large energy center, all of the pipeline methods of energy transport are superior to electric transmission from the viewpoints of heat rejection and the "getaway" problem.

(CHEMICAL HEAT-PIPE, HYDROGEN, METHANE, ENERGY TRANSPORT)

HP77 21009 LOW COST HIGH PERFORMANCE GENERATOR (LCHPG)

Lieberman, A.R., Osmeier, W.E., Hammel, T.E., Carpenter, R.T., (Teledyne Energy Systems, Timonium, MD), American Institute of Chemical Engineers, New York, 1976, Eleventh Intersociety Energy Conversion Engineering Conference, V 2
Avail:TAC

Teledyne Energy Systems (TES) has been under contract to U.S. Energy Research and Development Administration (ERDA) since 1973 to develop a low cost, high efficiency radioisotopic thermoelectric generator (LCHPG). The LCHPG technology is based on PU-238 oxide fuel and high performance selenide thermoelectrics under development by the 3M Company. Studies in the search for a safe, low weight, high performance generator have concluded in a 500 watt(E) LCHPG reference design which yields in excess of 10 percent system efficiency, more than 3 watts(E)/pound and greater safety and lower cost than existing rtgs. A typical LCHPG system has four heat pipe augmented fins, thermoelectric hot and cold junction temperatures of 900°A-C and 125°A-C, respectively, and a radiator temperature of 90°A-C. Power level typically can range from 25 to 500 watts(E) in 25 watt(E) modular increments. Production costs are expected to be about \$6000 per watt(E) by 1981. Most recent efforts have concentrated on hardware development and will culminate in 1978 in an electrically heated 100 watt(E) generator (ETG). This technology phase will emphasize development of ETG components, e.g., the selenide thermoelectrics, fibrous insulation, Cu / H¹⁸O₂ heat pipes and an isolation hot frame for separating the heat source from the converter compartment. Growth potential can be realized by uprating hot junction temperature and improving the gadolinium selenide N-LET / these improvements should yield an ultimate system efficiency of over 13 percent, a specific power in excess of 4 watts(e)/pound and a production cost less than \$5000 per watt(E).

HP77 22015 RESEARCH ON FLAT PIPE SOLAR COLLECTORS EMPLOYING THE HEAT PIPE PRINCIPLE FOR HEATING AND COOLING OF BUILDINGS

Bienart, W.B., (Dynatherm Corp., Cockeysville, MD), NSF-7409164, Aug 1974-Aug 1975
Avail:TAC

This project will study the feasibility of modular flat plate collectors employing the heat pipe principle to extract heat from the solar absorber surface and transport this heat to a primary fluid loop (either liquid or gas). The project will concentrate on the heat pipe collector surface and its interface with other module and system components. Existing research data on glazing, absorbing coatings and insulation will be utilized and not further developed in this project. A submodule-size heat pipe solar collector will be designed, constructed and tested to determine the overall thermal impedance of heat pipe solar collector. For this study, solar input will be simulated by electrical resistance strip heaters attached to the collector surface. A part of the submodule studies will be to identify possible failure mechanisms and conduct tests in which the processes leading to failure are accelerated. Based on the preceding studies, a full-scale module will be designed and fabricated and then tested under actual solar radiation. Parametric performance studies and economic analyses will be conducted as part of this program.

HP77 22016 DISTRICT HEATING FROM THE NUCLEAR POWER STATION BARSEBAECK IN SWEDEN

Blomqvist, O., Sydsvenska Kraft Ab, Malmoe, Sweden, July 1974, In Swedish

When the oil prices started to rise during the autumn of 1973, a rough estimate calculation showed that the conditions for heat transfer from the nuclear power station Barsebaeck, in Sweden to the cities Malmoe and Lund and perhaps also to Helsingborg and Landskrona are good. In the nuclear power station Barsebaeck the third plant may be used for both heat and power production. This report gives an account of the work being done.

HP77 22018 DOMESTIC BUILDING WITH A TEST SYSTEM FOR THE UTILIZATION OF SOLAR ENERGY

Dietrich, B., (Rheinisch-Westfaelisches Elektrizitaetswerk A.G., Essen, Germany, F.R., Abt. An Wend Ungstechnik), Tech. Eau, Brussels, V 3:237-243, 1976, In German

In Essen, a domestic building was equipped with a testing system for the utilization of solar energy for space heating and warm service water preparation with financial support by the Federal Ministry for Research and Technology. The system is to serve to collect practical experiences about expenses and efficiency of solar energy utilization for the heat supply of a domestic building built in conventional style and well insulated under the meteorological conditions of northern Germany. The flat plate collectors are installed on the southward sloping roof and function according to the heat-pipe-principle. The collector heat is led to the hot water storage in the cellar for service water preparation and heating via heat exchangers and a water circulation. The collectors efficiency can be increased by means of a heat pump, especially at times of little solar radiation. The installed hot-water floor heating ensures a low level of heating temperature. A flexible design of the energy system allows to test several conceptions of storing solar heat and using the additional energy necessary at times of bad weather conditions.

HP77 22019 NEW ENERGY CONSERVATION IDEAS FOR EXISTING AND NEW BUILDINGS

Dubin, F.S., (Dubin-Mindell-Bloome Associates, NY), 1975, CONF-750942

Avail:TAC

While the development of new materials and equipment to conserve energy is essential for the long term, even the existing techniques, equipment and systems which could reduce annual energy consumption are not being fully utilized in buildings because of institutional constraints. Many of the same constraints act to deter new developments. Those constraints are identified and new ideas for legislation, education and training, incentives, financing, research, and design methods to remove such constraints are suggested.

New equipment and system concepts are outlined, such as utilization of solar energy, heat pumps, heat pipes, desiccant dehumidification, and chilled and hot water storage systems / but it is shown that most of the new ideas are, in fact, innovative use of older technologies which must be reintroduced now. The importance of becoming thoroughly familiar with, and using, innovative systems which are available is stressed, rather than waiting for the development of new products. Examples are presented showing the energy conservation and economic benefits of industrial processes when integrated with building environmental control systems. Some suggestions are included for refrigeration equipment, and glass which changes its characteristics with varying ambient conditions. The use of these new products, which appear to be imminent, will result in lower capital costs, while increasing the potential for greater energy conservation in buildings.

HP77 22020 PARTICULATES COOL HEAT-RECOVERY UNITS

Edwards, P.L., Energy User News, V 1:18, N2, Oct 11, 1976
 Avail:TAC

Problems with heat recovery equipment used in industrial paint drying ovens are widespread. The most serious part of the problem is avoiding build-up of paint particulate matter that renders the heat recovery equipment ineffective. Avoiding the problem altogether can drive the cost of a system up five times, but reducing the problem to an annual maintenance chore is now within the means of major heat recovery equipment manufacturers. In the five years since the development of heat recovery as an adjunct to paint drying ovens, major suppliers have developed detailed application specifications to make the particulate problem manageable before installation. This is accomplished by minimizing the potential for particulate build-up and by insuring ready access to the equipment for ease of removing the paint or cleaning when it becomes necessary.

(ENERGY CONSERVATION, PAINT DRYING OVENS, INDUSTRIAL PLANTS)

HP77 22021 IMPROVEMENTS TO THE COOLING SYSTEM OF A FUSION REACTOR

Farfaletti-Casali, F., Peter, F.G., Gritzmann, P.G., Dec 17, 1975, British Patent 1,418,319/B//
 Avail:TAC

An improved cooling system is claimed for fusion reactors having a toroidal or linear configuration and having a Li blanket. In this kind of reactor the plasma cavity is surrounded by an annular chamber containing liquid Li, the main functions of which are to thermalise neutrons and to breed T at a rate greater than its consumption in the fusion process. The blanket zone is surrounded by another annular chamber containing graphite absorber, and by other moderating and shielding zones. Main problems requiring a satisfactory solution are cooling of the blanket and recovery of the T. The cooling system described consists of inner and outer concentric annular chambers, with a rigid wall separating these chambers. The inner chamber contains Li and the outer chamber contains a neutron moderating material such as graphite. A number of heat pipes are radially located in the chambers and pass through the intermediate wall for heat transfer from the inner to the outer chamber, and a cooling medium is provided to transfer heat from the outer chamber. The evaporation zones of the heat pipes are located in the Li in the inner chamber and the condensing zones are located in the moderating material in the outer chamber. The outer chamber is provided with vacuum means to remove the T extracted by the heat pipes from the Li in the inner chamber.

HP77 22022 COST-EFFECTIVENESS STUDY OF HEAT PIPE HEAT EXCHANGERS

Lu, D.C., Feldman, K.T., Jr., (Mechanical Engineering Department, Univ. of New Mexico, Albuquerque, NM), ASME Paper 77-WA/HT-5, Winter Annual Meeting, Atlanta, GA, Nov 27-Dec 2, 1977
 Avail:TAC

The high conductance of the heat pipe allows it to be used effectively in heat recovery heat exchangers. Such heat pipe heat exchangers may be used as recuperators in heating and ventilating systems and in a variety of process industry heat recovery applications. A research study is being conducted to optimize the performance and possibly reduce the costs of heat pipe heat exchangers. In this paper the initial costs of three types of heat pipe heat exchangers are presented: aluminum-Freon 11 for the temperature range from -23°C to 121°C (-10°F to 250°F), copper-water for 38°C to 232°C (100°F to 450°F), and carbon steel-Dowtherm A for 120°C to 400°C (248°F to 750°F). An optimization computer program for the cost-effectiveness analysis is developed, which takes into consideration the costs for equipment, installation, operation, and maintenance. An optimization example is given for a carbon steel-Dowtherm A heat pipe heat exchanger designed to recover heat from the 8534 m³/min (28,000 cfm) of 316°C (600°F) flue gas exhausting from the University heating plant boilers.

The results show that the investment in a heat pipe heat exchanger for heat recovery purposes is worthwhile, especially when rising fuel costs are considered.

HP77 22033 APPLICATION OF HEAT PIPES IN BOREHOLES WHEN DRILLING IN VACUUM AND REDUCED GRAVITATION CONDITIONS

Kopylov, V.E., Kulyabin, G.A., Grechin, E.G., (Tyumen' Ind Inst, USSR), Izv. Vyssh. Uchebn. Zaved., Gorn, Zh., V 5:93-99, 1975, In Russian

It is proposed to use heat pipes to remove heat from drill bits in pumpless drilling in a vacuum. The purpose is to prolong the service life of diamond or hard-alloy bits. Technological capabilities of pipes are considered. Their length is calculated in dependence on the working temperature of the bit, drilling rate and mechanical rock properties in the borehole. Conditions of starting the heat pipe from a frozen state are considered. Application for rock drilling on the moon is mentioned.

HP77 22034 APPLICATION OF HEAT PIPES TO GROUND STORAGE OF SOLAR ENERGY

Kroliczek, E.J., (B & K Engineering, Inc., Towson, MD), Yuan, S.W., Bloom, A.M., (George Washington University, Washington, DC), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-729
Avail:TAC

A heat pipe concept design for application to residential solar energy storage has been developed. The basic feasibility of the concept has been demonstrated in prototype testing at George Washington University. The design incorporates the simplicity and high efficiency of the heat pipe together with current heat pipe thermal control techniques and an external pump assist for liquid return against gravity. As configured the heat pipe system provides the capability of transferring heat from solar collectors to an energy storage area and points of utilization within a single heat transfer element. All control functions are inherent in the heat pipe construction including automatic shutdown of the solar collector zone when positive net energy flow is not achieved. Pumping power requirements are minimal and needed only during solar input periods. Future designs could utilize solar energy to drive the pump. Finally, the heat pipe

system can be interfaced with any one or combination of household heat transfer mediums including air, hot water or working fluids from air conditioners or heat pumps. This paper describes the concept, the details of a prototype design and the results obtained with a simulated ground storage test system.

HP77 22040 METHOD AND EQUIPMENT FOR HEAT RECOVERY OF FURNACES

Schneider, C., Poehlimann, E., Aug 21, 1975, German Patent 2,406,467/A//, In German

A method of heat recovery from furnaces is described in which the flue gases are passed through a stack. In the familiar types of furnaces the flue gases must have a minimum temperature above the dew point of the pollutants they contain to prevent such pollutants from condensing within the stack. In order to recover the thermal energy

contained in the flue gases, a heat exchanger is installed in the flue gas duct upstream of the stack to lower the flue gas temperature below the dew point temperature of the pollutants, in this way allowing the pollutant condensates to be removed from the flue gas duct. The heat exchangers which lend themselves to this application are in particular systems with heat pipes. The heat is best removed by forced venting of the cold side of the heat exchanger. If, as a result of the cooling of the flue gases, the draft in the stack is insufficient, it is advisable to accelerate the flue gases by fans after the cooling stage.

HP77 22041 CONTRIBUTION TO THE BOILING CURVE OF SODIUM

Schins, H.E.J., (Technol. Div. JRC-Ispra Establ. Ispra, Italy), Atomkernenergie, Germany, V 26:48-52, N1

Avail:TAC

Sodium was preheated to saturation temperatures at pressures of 200, 350 and 500 torr. A test section of normal stainless steel was then heated by means of the conical fitting condenser zone of a heat pipe. Measurements were made of heat transfer flux, Q in W/cm^2 , as a function of wall excess temperature above saturation, in natural convection and boiling regimes. These measurements make it possible to select the subbotin natural convection and nucleate boiling curves among other variants proposed in literature. It is empirically demonstrated on water that the minimum film boiling point corresponds to the homogeneous nucleation temperature calculated by the Doring Formula. Assuming that the minimum film boiling point of sodium can be obtained in the same manner, it may be possible to give an approximate boiling curve of sodium for the use in thermal interaction studies.

 Avail:TAC

This project undertakes research and development focused on key technology of photothermal conversion for efficient use of solar energy in large-scale production of electricity. The program includes (1) research and development on components of the system, (2) heat transfer studies on system components, (3) systems performance and tradeoff analysis, and (4) design, construction, and demonstration testing of a modular unit of the proposed collection system. The main system components under study are a solar concentrator which focuses solar energy on a heat pipe, a heat pipe with a selective optical coating, a heat transfer loop connecting the heat pipe to a thermal storage unit, and a thermal storage unit which receives thermal energy from the transfer loop and releases it to the power cycle working fluid. Eight study tasks are undertaken (including experimental work on many of them) as follows: (1) solar reflector surface life, (2) solar absorber coating life, (3) gravity-aided long heat pipes, (4) heat transfer and pressure drop in a transfer loop, (5) heat transfer in a central storage facility, (6) heat transfer in a decentralized storage facility, (7) system design, and (8) module demonstration.

HP77 23003 COMPARISON OF NUCLEAR SPACE POWER SYSTEMS WITH TURBOELECTRIC AND WITH THERMIONIC CONVERTERS

Blumenberg, J., (Technische Univ., Munich), Kerntechnik, V 18:29-35, N1, 7 refs, Jan 1976, In German and English
 Avail:TAC

Future space power systems with high power ratings will work on the basis of fast nuclear reactors, heat pipe radiators and high efficiency power converters. Comparison shows that the formerly held assumption that thermionic systems are superior is valid to only a very limited extent. For the same net electric power ratings, and applying comparable technological standards, the turbo-electric systems are characterized over the entire achievable range of hot side temperatures and net electric power ratings by lower specific masses, lower cold side temperatures and a very much less sensitive dependence of the specific mass on variations of the hot side temperature.

HP77 23004 COMPARATIVE ASSESSMENT OF OUT-OF-CORE NUCLEAR THERMIONIC POWER SYSTEMS

Estabrook, W.C., Koenig, D.R., Prickett, W.Z., (JPL, Pasadena, CA), Nov 15, 1975, N76-14193

The hardware selections available for fabrication of a nuclear electric propulsion stage for planetary exploration were explored. The investigation was centered around a heat-pipe-cooled, fast-spectrum nuclear reactor for an out-of-core power conversion system with sufficient detail for comparison with the in-core system studies completed previously. A survey of competing power conversion systems still indicated that the modular reliability of thermionic converters makes them the desirable choice to provide the 240-kWE end-of-life power for at least 20,000 full power hours. The electrical energy will be used to operate a number of mercury ion bombardment thrusters with a specific impulse in the range of about 4,000-5,000 seconds.

HP77 23005 THERMAL CONTROL OF THE INTERNATIONAL ULTRAVIOLET EXPLORER

Skladany, J.T., Seivold, A.L., (NASA Goddard Space Flight Center, Greenbelt, MD), Am. Soc. Mech. Eng., Paper 76-ENAS-38, July 12, 1976

The International Ultraviolet Explorer (IUE) is a large astronomical observatory scheduled to be placed in a three-axis stabilized synchronous orbit in the fourth quarter of 1977. The thermal control system consists of multilayer insulation, ammonia-filled grooved heat pipes, bimetallic actuated louvers, and assorted commandable heaters. The spacecraft must operate over a 135-deg solar aspect range and must be able to survive an 85-min.-zero power eclipse. It has a design lifetime of three years. To verify the thermal design, an engineering test unit (ETU) was subjected to a thermal balance test in the solar environment simulator (SES) at the Goddard Space Flight Center (GSFC). Heater skins were utilized to simulate four solar aspect angles, and various internal power settings were used to simulate different operational cases. Temperatures obtained corresponded within 5°C of predicted values, thus verifying the thermal analytical model. In addition, two 85-min.-eclipse periods were successfully completed verifying that the thermal design of the IUE was adequate for this mission requirement.

HP77 24003 HEAT PIPE COPPER VAPOR LASER. FINAL TECHNICAL REPORT, 1 FEB 1973-30 JUNE 1974

Chimenti, R.J.L., (Exxon Research and Engineering Co., Linden, NJ, Government Research Lab.), Nov 1974, AD/A--005004

Avail:TAC

The program objective was the development of a copper vapor laser in which the copper was contained within a heat pipe and whose vapor density could be controlled by an inert gas. Successful operation of a heat pipe with graphite and tungsten as the materials of construction was obtained to temperatures of 2100°C. Both helium and argon were used for the control of the copper vapor pressure. The second aspect of the program was the development of a discharge configuration capable of the production of high current, short risetime excitation in the vapor and compatible with the heat pipe structure.

Pulse generators were developed which were integral with the laser structure and had variable pulse repetition rates from one to 10,000 pulses per second. In the third part of the program investigation of laser action obtained in the heat pipe was carried out. Laser action at both 5106 and 5782 Å was successfully demonstrated at temperatures between 1500 and 1900°C. Multiple laser pulses resulting from a single excitation pulse have been observed at temperatures above 1700°C with pulse widths less than 2.5 NS (bandwidth limited).

HP77 24007 HEAT REJECTION SYSTEMS FOR ELECTROCHEMICAL EQUIPMENT

Kaufmann, J.J., Perreault, W., (NASA, Marshall Space Flight Center, Electronics and Control Lab., Marshall Space Flight Center, AL), NASA-909-51-02 (FY73), NASA-909-55-02 (FY74), NASA-909-55-02 (FY75), July 1972-Dec 1976, Sponsored by Office of Manned Space Flight
Avail:TAC

The objective of this project is to perform basic R&D tasks related to optimization of heat rejection systems using heat pipes operating between 10°C and 100°C for alkaline-hydrogen-oxygen fuel cells, batteries and other astrionic packages. The basic technology for heat pipes of the type required already exists. Additional development is required to resolve operational problems such as cold startup, G-force effect and restart. Specific development is required to assure that heat pipe systems can be applied in fuel cell stacks, batteries, and small astrionics packages. For example, in concentrated heat applications such as inverters, it is important to remove generated heat from printed wiring boards to the housing. Technology is needed especially to conduct heat across the interface between a "slide-in" printed wiring board and the housing. Thermal analyses will be conducted to evaluate possible use of heat pipes as a passive thermal control device for the tug fuel cell, internal portion of a battery housing to housing interface, and printed-wiring-boards-to-housing for astrionics. Should the heat pipe approach prove to be unacceptable, alternate methods will be considered. Tests will be conducted on the various candidate applications to verify the analyses and acceptability of the concept.

HP77 24010 A TWO-LEVEL, HIGH-POWER, AIR-COOLED TRAVELING-WAVE TUBE FOR COMMUNICATION SYSTEMS

Leborgne, R.H., (Electron Dynamics Div., Hughes Aircraft Co., Torrance, CA), 1975
 International Electron Devices Meeting, Technical Digest, Washington, DC, Dec 1-3, 1975
 Avail:TAC

A two-level 600/1200 watt CW, x-band, coupled cavity traveling-wave tube with low distortion characteristics and air cooling enhanced by the use of heat pipes is described. This lightweight tube developed for military communication ground terminals is PPM focused and incorporates heat pipes on the RF circuit to uniformly distribute the relatively high thermal loads insuring reliable air cooling. The tube provides either 600 or 1200 watts of saturated CW output power over the frequency band 7.9 to 8.4 GHz. With two levels of saturation achieved by varying the voltage on an isolated anode, the effective perveance of the electron gun is increased and gain variations of less than 1.2 DB have been achieved across the 500 MHz band.

HP77 30012 CONTROLLABILITY ANALYSIS FOR PASSIVELY AND ACTIVELY CONTROLLED HEAT PIPES

Lehtinen, A.M., (Rockwell International, Downey, CA), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-776

Avail:TAC

An analytical technique was developed for steady state and pseudo-transient control analysis of variable conductance heat pipes (VCHP) and feedback controlled heat pipes (FCHP). The approach uses a modified vapor temperature profile and a simple 5-node thermal network. This approach differs from past techniques in that it accounts for gas blockage of the adiabatic section and the set point temperature is referenced to the control point node rather than the vapor node. In FCHP systems, the gas inventory is determined at a design set point temperature and held constant for analysis of varying controller set point temperatures. The pseudo-transient analysis integrates the reservoir response time equations with the steady state control equations. The most significant findings were that reservoir volume increases due to controller set point, response time, and reservoir temperature limitations; and the existence of minimum and maximum controller set point temperatures when reservoir temperature limitations exist.

HP77 31007 THE MULTISTAGE HEAT PIPE RADIATOR - AN ADVANCEMENT IN PASSIVE COOLING TECHNOLOGY

Wilson, D.E., Wright, J.P., (Rockwell International, Downey, CA), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-760

Avail:TAC

Mathematical models were developed for one-, two-, and three-stage radiator systems to determine optimum stage areas and system performance as a function of such parameters as insulation effectiveness, cold stage temperature, and heat load to the cold and intermediate stages. This study shows that multi-stage radiator systems can be optimized on the basis of weight or projected area, and that cold stage temperatures as low as 15°K are theoretically possible with present technology levels for insulation emittance. Optimum radiator geometry for a given temperature was found to be independent of the magnitude of the heat load; hence, the results can be scaled up or down for any size system. The addition of a heat load to the intermediate stage did not significantly affect cold stage heat rejection for heat loads up to 10 times the cold stage load. This is significant for sensor systems requiring additional cooling at intermediate temperatures. For the baseline design, analyses were performed to determine optimum radiator fin geometry and heat pipe spacing as a function of temperature, material properties, and heat pipe weight. In addition, a ground test system was designed for the baseline design with heat rejection requirements of 10 mW at 35°K on the cold stage and 100 mW at the second stage.

HP77 31010 A ZERO G VARIABLE CONDUCTANCE HEAT PIPE USING BUBBLE PUMP INJECTION

Roberts, C.C., Jr., (Engineering Consultant, Packer Engineering Associates, Naperville, IL), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-752 Avail:TAC

Methods for varying the thermal conductance of a heat pipe include liquid flow control, vapor flow control and condenser blockage. A new way to vary heat pipe thermal conductance has been achieved by using a bubble pump to control return liquid flow. This has been proven in a 1-g environment. In an attempt to apply this concept to the 0-g environment, various heat pipe fluid models were tested on a 0-g simulator. The design appears feasible over a range of Bond Numbers from 0-16.

HP77 31011 THE EFFECT OF THE LIQUID-SOLID SYSTEM PROPERTIES ON THE INTERLINE HEAT TRANSFER COEFFICIENT

Wayner, P.C., Jr., (Dept. of Chemical and Environmental Engineering, Rensselaer Polytechnic Institute, Troy, NY), Aug 1977 Avail:TAC

A theoretical procedure to determine the heat transfer characteristics of the interline region of an evaporating meniscus using the macroscopic optical and thermophysical properties of the system is outlined. The analysis is based on the premise that the interline transport processes are controlled by the London-van der Waals forces between condensed phases (solid and liquid). The procedure is used to compare the relative size of the interline heat sink of various systems using a constant heat flux model. This solution demonstrates the importance of the interline heat flow number, $\bar{A} \text{ hfg } v^{-1}$, which is evaluated for various systems. The heat transfer characteristics of the decane-steel system are numerically compared with those of the carbon tetrachloride-quartz system. In order to evaluate the theoretical models and obtain direction for their refinement, the length of the interline region and the stability of the meniscus should be experimentally determined as a function of the heat flux and the interline heat flow number.

(EVAPORATING MENISCUS, INTERLINE TRANSPORT, LONDON-VAN DER WAALS FORCE)

HP77 31012 TRANSFER PROCESSES IN AN EVAPORATING MENISCUS AND ADSORBED THIN FILM

Wayner, P.C., Jr., (Dept. of Chemistry, Dept. of Environmental Eng., Rensselaer Polytechnic Institute, Troy, NY), Aug 1971-Nov 1976, National Science Foundation Avail:TAC

The transport processes occurring in evaporating meniscus and adsorbed thin film are being studied experimentally and theoretically. This basic research study is concerned with understanding the processes of boiling, dropwise condensation, transpiration cooling and the rewetting of a hot spot. Evaporation from porous media is also being studied experimentally and theoretically. The research is directed toward the understanding and design of "heat pipe" type heat exchangers.

HP77 32006 EXCESS LIQUID IN HEAT-PIPE VAPOR SPACES

Eninger, E., Edwards, D.K., (TRW Defense and Space Systems Group, Redondo Beach, CA), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-748
 Avail:TAC

A mathematical model is developed of excess liquid in heat pipes that is used to calculate the parameters governing the axial flow of liquid in fillets and puddles that form in vapor spaces. In an acceleration field, the hydrostatic pressure variation is taken into account, which results in noncircular meniscus shapes. The two specific vapor-space geometries considered are circular and the "Dee-shape" that is formed by a slab wick in a circular tube. Also presented are theoretical and experimental results for the conditions under which liquid slugs form at the ends of the vapor spaces. These results also apply to the priming of arteries.

(MATHEMATICAL MODEL, AXIAL FLOW, MENISCUS SHAPES, PRIMING)

HP77 32007 INVESTIGATION OF COUNTERFLOW SHEAR EFFECTS IN HEAT PIPES

Feldman, K.T., Jr., Thupvongsa, C., (Mechanical Engineering Department, The University of New Mexico, Albuquerque, NM), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-749
 Avail:TAC

In this study the entrainment-shear performance limit which occurs in heat pipes was investigated and explained. In the existing heat pipe literature the entrainment heat flux limit is defined as the condition where the Weber number is greater than or equal to one. In this analysis, the critical value for the entrainment Weber number is found to be $2\pi \leq We \leq 3\pi$. Perhaps more important to the heat pipe designer than the entrainment performance limit is the prediction of the performance degradation due to vapor-liquid shearing stress which is also described. Preliminary qualitative experiments were conducted to observe the shear stress wave formation phenomena. The equations presented in this analysis may be used to predict and minimize the vapor-liquid shear stress performance effects that occur in axial groove and puddle flow artery heat pipes.

HP77 32008 PERFORMANCE OF GRAVITY-ASSISTED HEAT PIPES OPERATED AT SMALL TILT ANGLES

Kamotani, Y., (Department of Mechanical and Aerospace Engineering, Case Western Reserve University, Cleveland, OH), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-750
 Avail:TAC

Performance of a gravity-assisted heat pipe operated at small tilt angles is investigated theoretically including the effect of vapor-shear. The vapor-shear creates a back-flow region at the surface of the puddle, and thereby degrades the pipe performance. A formula is obtained for the liquid pressure drop which accounts for the vapor shear effect. The performance of the pipe is strongly influenced by the fluid inventory and the tilt. It is found that if the fluid charge exceeds a certain amount, the pipe operation becomes unstable at a relatively small heat transport.

HP77 40009 HEAT PIPE: A NEW CANDIDATE FOR POWER PLANT HEAT RECOVERY

(Electr. Light Power, Boston, MA), V 54:18-19, N3, Mar 15, 1976
Avail:TAC

The design, operation, performance, and limitations of finned heat exchangers made of several hundred heat pipes are discussed. Possible uses of these units to recover waste heat in power plants are described and include reheating of exhaust gas from sulfur scrubbers and heat recovery from gas turbine exhaust gas to preheat incoming air, thereby improving the efficiency of the turbine and reducing thermal pollution effects.

(WASTE HEAT, SCRUBBERS, EXHAUST GAS, THERMAL POLLUTION)

HP77 40010 HEAT PIPE HEAT EXCHANGER DESIGN AND OPTIMIZATION

Feldman, K.T., Lu, D.C., (Dept. of Mech. Engrg. and Bureau of Engrg. Research, Univ. of New Mexico, Albuquerque, NM), NSF-374-1, July 1977, Final Report No. ME-81(77)
Avail:TAC

Heat pipe heat exchangers are competitive in heat recovery applications because they have many advantages over other conventional heat exchangers such as rotary regenerators and runaround heat exchangers. In order to design a heat pipe heat exchanger with optimum cost-effectiveness and best overall performance, an optimization model to minimize the total cost is developed. The computed results of an example using this model are presented. These lead to the conclusion that the total long-range fuel saving is very high. The Colburn modulus j and friction factor f are presented in terms of the Reynolds number for staggered finned-tube banks with segmented helical circular fins, solid helical circular fins, and corrugated plate fins. Three types of heat pipes for heat exchanger design are investigated: carbon steel-Dowtherm A heat pipes, copper-water heat pipes, and aluminum-Freon 11 heat pipes. A simple method using the thermal resistances approach is described to analyze the performance of heat pipe heat exchangers. The influences of various parameters on effectiveness and pressure drop of the heat exchanger depends on the maximum axial heat transfer rate of each heat pipe in the exchanger. Taking the vapor shear effect on the liquid-vapor interface into account, a thread-puddle-artery heat pipe has a much smaller axial heat transfer rate than would be expected with working fluids such as water or Dowtherm A. One drawback of heat pipe heat exchangers is their relatively high initial cost. Further studies to improve their performance and to cut down their expense are recommended.

(COST EFFECTIVENESS, OPTIMIZED MODEL, THREAD-PUDDLE-ARTERY HEAT-PIPE)

HP77 40011 RE-ENTRANT GROOVE HEAT PIPE

Harwell, W., (Grumman Aerospace Corporation, Bethpage, NY), Kaufman, W.B., Tower, L.X., (NASA, Lewis Research Center, Cleveland, OH), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-773
Avail:TAC

This paper describes theoretical and experimentally verified heat pipe characteristics of an axially grooved aluminum extrusion with a re-entrant groove profile. The extrusion is 13 mm diameter with 20 axial grooves, each groove consisting of a nominal .8 mm diameter channel with a .2 mm wide passageway connecting the channel to the hollow core. A computer program was written to compute the zero gravity heat transport capability of the extrusion. A heat pipe was fabricated and its performance characteristics measured. The characteristics of the pipe with ammonia at 20°C are: zero gravity pumping limit 143 w-meters; static wicking height 21.5 mm; evaporator and condenser coefficients 7300 and 20,500 watt/m²°C, respectively.

(ALUMINUM EXTRUSION, AMMONIA, COMPUTER PROGRAM)

HP77 40012 HEAT PIPE AND METHOD OF PRODUCTION OF A HEAT PIPE

Kemp, R.S., May 22, 1975, German Patent 2,453,956/A//, In German

The heat pipe consists of a copper pipe in which a capillary network or wick of heat-conducting material is arranged in direct contact with the pipe along its whole length. Furthermore, the interior space of the tube contains an evaporable liquid for pipe transfer. If water is used, the capillary network consists of, e.g., a phosphorus band network. To avoid contamination of the interior of the heat pipe during sealing, its ends are closed by mechanical deformation so that an arched or plane surface is obtained which is in direct contact with the network. After evacuation of the interior

space, the remaining opening is closed with a tapered pin. The ratio wall thickness/tube diameter is between 0.01 and 0.6.

HP77 40016 FLEXIBLE CRYOGENIC HEAT PIPE DEVELOPMENT PROGRAM - Final Report

Wright, J.P., (Rockwell International, Space Division, Downey, CA), NASA CR 152027, July 1977, NAS2-8830
Avail:TAC

This report summarizes the results of Contract NAS2-8830, "Development of a Flexible Cryogenic Heat Pipe Program." The program was initiated in July 1975 and was completed in July 1977. The program was an analytical and experimental technology development effort to develop the technology and experience necessary for successful application of high performance flexible cryogenic heat pipes. Two pipes were designed and fabricated for testing and evaluation. One was designed for operation in the 100-200 K temperature range with maximum heat transport as a primary design goal; the other was designed for operation in the 15-100 K temperature range with maximum flexibility as a design goal.

HP77 41014 A STRUCTURED SURFACE FOR HIGH PERFORMANCE EVAPORATIVE HEAT TRANSFER

Saaski, E.W., Hamasaki, R.H., (Sigma Research, Inc., Richland, WA), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-778
 Avail:TAC

An evaporative surface is described for heat pipes and other two-phase heat transfer applications that consists of a hybrid composition of V-grooves and capillary wicking. Characteristics of the surface include both a high heat transfer coefficient and high heat flux capability relative to conventional open-faced screw thread surfaces. With a groove density of 12.6 cm^{-1} and ammonia working fluid, heat transfer coefficients in the range of 1 to $2 \text{ W/cm}^2\text{K}$ have been measured, along with maximum heat flux densities in excess of 20 W/cm^2 . A peak heat transfer coefficient in excess of $2.3 \text{ W/cm}^2\text{K}$ at 20 W/cm^2 was measured with a 37.8 cm^{-1} hybrid surface.

HP77 42005 WETTING AND SURFACE PROPERTIES OF REFRIGERANTS TO BE USED IN HEAT PIPES

Reale, F., Cannaviello, M., (Istituto di Fisica Tecnica, University of Napoli, Italy)
 Avail:TAC

A simple and yet accurate method of measuring surface properties of fluids is presented. Surface tension and contact angles are investigated for some organic coolants, R-11, 12, 21, 22, 114 and 502.

(CONTACT ANGLE, SURFACE TENSION, ORGANIC COOLANTS)

HP77 42006 TWO-PHASE WORKING FLUIDS FOR THE TEMPERATURE RANGE 100-350°C

Saaski, E.W., (Sigma Research, Inc., Richland, WA), Tower, L., (NASA Lewis Research Center, Cleveland, OH), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-753
 Avail:TAC

The decomposition and corrosion of two-phase heat transfer liquids and metal envelopes have been investigated on the basis of molecular bond strengths and chemical thermodynamics. Potentially stable heat transfer fluids for the temperature range 100°C to 350°C have been identified, and reflux heat pipe tests initiated with 10 fluids and carbon steel and aluminum envelopes to experimentally establish corrosion behavior and noncondensable gas generation rates.

V. TESTING AND OPERATION

HP77 50024 THE HEAT PIPE HEAT BRIDGE AND THERMAL CONTROLLER

Arcella, F.G., (Westinghouse Research and Development Center, Pittsburgh, PA), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-751
 Avail:TAC

A novel heat pipe heat bridge is described. A non-condensable gas pocket is placed in a heat pipe between axially opposed heat sources. The gas pocket, driven by each heat source, assumes a position in the common condenser zone that is indicative of the strength of each heat source. The resulting "heat bridge" operated much like an electrical bridge and can be employed in many new and novel heat flow and analysis situations. One application of this new concept heat pipe heat bridge is heat monitoring. Analyses show that one or two simple temperature, wattage, or length measurements will suffice to determine heat flow accurately. The heat pipe heat bridge (HPHB) is a modified version of a gas buffered, variable conductance heat pipe (VCHP) and is, in fact, an infinite set point (ISP) VCHP. The HPHB thus acts as a thermal controller and will function at an infinite number of temperatures, which can be pre-selected by the operator, or varied during operation to meet variable temperature or heat flux requirements. The HPHB is also an infinite set point heat flow gate and becomes a means to direct heat flows in branching situations. An experimental heat pipe heat bridge was constructed and tested and has verified the principles of operation. Other applications of this new instrument, including its employment as an infinitely variable, feedback control thermal controller, are described.

HP77 50025 BOILING LIMITED HEAT PIPES IN A MID-TEMPERATURE RANGE (150 TO 300 C)

Brown, A., (Dept. of Mechanical Engineering and Engineering Production, University of Wales Institute of Science and Technology, Cardiff, Wales), AIChE-ASME Heat Transfer Conference, Salt Lake City, UT, Aug 15-17, 1977, ASME Paper 77-HT-39
 Avail:TAC

This paper describes measurements made of evaporator performance for heat pipes with wicks made from two layers of fine wire mesh, one being 100 mesh and the other 400 mesh formed into a polygon section spotwelded to the pipe at the apices of the polygon. Both Thermex and water are used as working fluid. The significant contribution of this paper is in the comparison of the performance of heat pipes with Thermex and water as a working fluid operating under the same conditions. Also for composite wick geometry heat pipes boiling limited evaporation is observed and discussed.

(WICK, WATER, THERMEX, GEOMETRY, WIRE-MESH)

HP77 50026 DYNAMIC TESTING OF A CRYOGENIC HEAT PIPE/RADIATOR

Cenkner, A.A., Jr., (Bell Aerospace TEXTRON, Buffalo, NY), Nelson, B.E., Chuvala, J.T., (Perkin-Elmer Corporation, Danbury, CT), Sixth International Heat Transfer Conf., Toronto, Ontario Canada, Aug 7-11, 1977
 Avail:TAC

An experimental investigation was performed to determine the dynamic characteristics of two fixed conductance cryogenic heat pipe/radiators, 1.3 and 6.4 meters long. Included was the response of Freon-13 and nitrogen filled pipes to step changes in evaporator power, as well as response during natural and (evaporator) powered cooldown to the cryogenic regime. Key features of the transient response, subsequent to step power changes that encompassed 2.2 and 62.6 watts (about 87°K to 230°K), include the following: (1) Pipe response was well-behaved with monotonic changes in temperature levels. (2) Once start-up occurred, a relatively large attached distributed mass had a minor effect on pipe performance. (3) Pipe response times for large power changes were fairly long, being measured in hours. (4) It was possible to speed elevation of the pipe temperature by overdriving the evaporator. Preliminary findings on natural cooldown to the cryogenic regime indicated that, under certain conditions, heat pipe/radiators will fail to start naturally as a result of radiator drop-out. Powering of the evaporator during cooldown was shown to be one method of achieving startup. It was also demonstrated that a common Lobar Wick design can be utilized to provide thermal control over an extremely wide temperature range of at least 74-230°K.

HP77 50027 HEAT PIPE RECOVERY SYSTEM STUDY - Final Report

(Dynatherm Corporation, Cockeysville, MD), NAS5-22998, DTM-77-1
 Avail:TAC

Industrial process air-to-air heat recovery systems utilizing heat pipes have demonstrated operating performances which are substantially below predicted capabilities.

A study conducted under contract NAS5-22998 has indicated that this inadequate performance is due to liquid-vapor interaction within the heat pipe(s) and recommends experimental investigation of the phenomena. A second phase of the above contract was initiated to investigate the liquid-vapor interaction. A heat pipe design incorporating a viewing port was employed for fluid motion investigations, and tests were conducted with two fluids, various charges, and numerous heat pipe orientations.

(LIQUID-VAPOR, HEAT TRANSFER, BOILING, STABILITY)

HP77 50028 INSTRUMENT CANISTER THERMAL CONTROL

Harwell, W., Haslett, R., (Grumman Aerospace Corporation, Bethpage, NY), Ollendorf, S., (NASA, Goddard Space Flight Center, MD), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-752
Avail:TAC

A transient thermal analysis and test of a thermal control canister is described. The 1 x 1 x 3m canister provides a uniform thermal environment for shuttle instrument payloads requiring fine temperature control, the design goal being operation between 0°C and 20°C with a range of $\pm 1^\circ\text{C}$ at any selected set-point temperature. The canister side walls are isothermalized by a system of longitudinal and circumferential heat pipes rejecting heat through feedback controlled, variable conductance heat pipes to side mounted radiators. A breadboard model of two side walls and two radiators was tested in a thermal vacuum chamber. The breadboard was stable over a wide range of effective environments, experiment dissipations, and control point temperature levels.

(ISOTHERMAL, VCHP, BREADBOARD MODEL)

HP77 50029 PRELIMINARY EVALUATION OF A HEAT PIPE HEAT EXCHANGER ON A REGENERATIVE TURBOFAN

Kraft, G.A., (NASA, Cleveland, OH, Lewis Research Center), Dec 1975, N76-13101
Avail:TAC

A preliminary evaluation was made of a regenerative turbofan engine using a heat pipe heat exchanger. The heat exchanger had an effectiveness of 0.70, a pressure drop of 3 percent on each side, and used sodium for the working fluid in the stainless steel heat pipes. The engine was compared to a reference turbofan engine originally designed for service in 1979. Both engines had a bypass ratio of 4.5 and a fan pressure ratio of 2.0. The design thrust of the engines was in the 4000 N range at a cruise condition of mach 0.98 and 11.6 km. It is shown that heat pipe heat exchangers of this type cause a large weight and size problem for the engine. The penalties were too severe to be overcome by the small uninstalled fuel consumption advantage. The type of heat exchanger should only be considered for small airflow engines in flight applications. Ground applications might prove more suitable and flexible.

(TURBOJET ENGINE, HEAT EXCHANGER, TESTING, SODIUM, STAINLESS STEEL)

HP77 50030 A PRECISE SATELLITE THERMAL CONTROL SYSTEM USING CASCADED HEAT PIPES

Steele, W.H., (McDonnell Douglas Astronautics Company, St. Louis, MO), McKee, H.B., (Frito-Lay, Inc., Irving, TX), AIAA 12th Thermophysics Conf., Albuquerque, NM, June 27-29, 1977, Paper No. 77-777
Avail:TAC

A cascaded, dry reservoir, variable conductance heat pipe system was tested. Results show passive temperature control within $\pm 0.5^\circ\text{F}$ of the desired set point for a wide range of heat input and effective space environment temperatures. The use of long capillary tubes to isolate the reservoir and prevent set point temperature change due to cyclic heat loads and/or cyclic environment temperature was demonstrated. Orbit set point temperature control feasibility was investigated using variable volume control gas reservoirs. Set point temperature adjustment over a range from 50°F to 90°F was successfully achieved with high control accuracy.

(PASSIVE TEMPERATURE CONTROL, CYCLIC HEAT LOAD, CONTROL ACCURACY)

HEAT PIPE RELATED PATENTS

PATENTS

00037 LAMP, T.R.
WATER HEAT PIPE WITH IMPROVED COMPATABILITY
U.S. PATENT 4043387
AUGUST 23, 1977

00038 HAWS, J.L. QUINNEY, D.W.
RICHARDS, F.A.
HEAT PIPE COOLING OF AIRBORNE PHASED ARRAY RADAR
U.S. PATENT 4044396
AUGUST 23, 1977

00039 FUJIE, K. ITOH, M.
INNAMI, T. KIMURA, H.
NAKAYAMA, W. YANAGIDI, T.
HEAT TRANSFER PIPE
U.S. PATENT 4044797
AUGUST 30, 1977

00040 TSAI, Y.W. SENSI, J.E.
HENRY, A. HENRY V.I.
GLASSMAKING FURNACE EMPLOYING HEAT PIPES FOR
PREHEATING GLASS BATCH
U.S. PATENT 4045197
AUGUST 30, 1977

00041 MARCUS, B.D. FLEISCHMAN, G.L.
FLAT-PLATE HEAT PIPE
U.S. PATENT 4046190
SEPTEMBER 6, 1977

00042 SEKHON, K.S. NELSON, L.A.
FRITZ JR., J.E.
TRANSISTOR COOLING BY HEAT PIPES HAVING A WICK OF
DIELECTRIC POWDER
U.S. PATENT 4047198
SEPTEMBER 6, 1977

00043 BINERT, W.B. PRAVDA, M.F.
DOWN-PUMPING HEAT PIPES
U.S. PATENT 4050509
SEPTEMBER 27, 1977

00044 BASIULIS, A
HEAT PIPE CAPABLE OF OPERATING AGAINST GRAVITY
AND STRUCTURES UTILIZING SAME
U.S. PATENT 4057563

00045 IRIARTE, W.R.
HEAT PIPE WITH CAPILLARY GROOVE AND FLOATING ARTERY
U.S. PATENT 4058159
NOVEMBER 15, 1977

00046 CORMAN, J.C. WALMET, G.E.
HEAT TRANSFER DEVICE
U.S. PATENT 4058160
NOVEMBER 15, 1977

INDEX OF TITLES (PERMUTED)

•A • NOT INDEXED
 00044 EAT PIPE CAPABLE OF OPERATING AGAINST GRAVITY AND STRUCTURES
 00038 HEAT PIPE COOLING OF AIRBORNE PHASED ARRAY RADAR#
 •AND • NOT INDEXED
 00038 PE COOLING OF AIRBORNE PHASED ARRAY RADAR# HEAT PI
 00045 CAPILLARY GROOVE AND FLOATING ARTERY# HEAT PIPE WITH
 00040 AT PIPES FOR PREHEATING GLASS BATCH# /G FURNACE EMPLOYING HE
 •BY • NOT INDEXED
 00044 RAVITY AND STRUCTU/ HEAT PIPE CAPABLE OF OPERATING AGAINST G
 00045 ARTERY# HEAT PIPE WITH CAPILLARY GROOVE AND FLOATING
 00037 WATER HEAT PIPE WITH IMPROVED COMPATABILITY#
 00042 WICK OF DIELECTR/ TRANSISTOR COOLING BY HEAT PIPES HAVING A
 00038 AY RADAR# HEAT PIPE COOLING OF AIRBORNE PHASED ARR
 00046 HEAT TRANSFER DEVICE#
 00042 Y HEAT PIPES HAVING A WICK OF DIELECTRIC POWDER# / COOLING B
 00043 DOWN-PUMPING HEAT PIPES#
 00040 ATING GL/ GLASSMAKING FURNACE EMPLOYING HEAT PIPES FOR PREHE
 00041 FLAT-PLATE HEAT PIPE#
 00045 IPE WITH CAPILLARY GROOVE AND FLOATING ARTERY# HEAT P
 •FOR • NOT INDEXED
 00040 OR PREHEATING GL/ GLASSMAKING FURNACE EMPLOYING HEAT PIPES F
 00040 ING HEAT PIPES FOR PREHEATING GLASS BATCH# /G FURNACE EMPLOY
 00040 HEAT PIPES FOR PREHEATING GL/ GLASSMAKING FURNACE EMPLOYING
 00044 CAPABLE OF OPERATING AGAINST GRAVITY AND STRUCTURES UTILIZI
 00045 HEAT PIPE WITH CAPILLARY GROOVE AND FLOATING ARTERY#
 00042 NSISTOR COOLING BY HEAT PIPES HAVING A WICK OF DIELECTRIC PO
 00044 AGAINST GRAVITY AND STRUCTU/ HEAT PIPE CAPABLE OF OPERATING
 00038 PHASED ARRAY RADAR# HEAT PIPE COOLING OF AIRBORNE
 00045 E AND FLOATING ARTERY# HEAT PIPE WITH CAPILLARY GROOV
 00037 ABILITY# WATER HEAT PIPE WITH IMPROVED COMPAT
 00041 FLAT-PLATE HEAT PIPE#
 00040 GLASSMAKING FURNACE EMPLOYING HEAT PIPES FOR PREHEATING GLAS
 00042 ELECTR/ TRANSISTOR COOLING BY HEAT PIPES HAVING A WICK OF DI
 00043 DOWN-PUMPING HEAT PIPES#
 00046 HEAT TRANSFER DEVICE#
 00039 HEAT TRANSFER PIPE#
 00037 WATER HEAT PIPE WITH IMPROVED COMPATABILITY#
 •OF • NOT INDEXED
 00044 STRUCTU/ HEAT PIPE CAPABLE OF OPERATING AGAINST GRAVITY AND
 00038 HEAT PIPE COOLING OF AIRBORNE PHASED ARRAY RADAR#
 00044 NST GRAVITY AND STRUCTU/ HEAT PIPE CAPABLE OF CPERATING AGAI
 00038 D ARRAY RADAR# HEAT PIPE COOLING OF AIRBORNE PHASE
 00045 FLCATING ARTERY# HEAT PIPE WITH CAPILLARY GROOVE AND
 00037 TY# WATER HEAT PIPE WITH IMPROVED COMPATABILI
 00039 HEAT TRANSFER PIPE#
 00041 FLAT-PLATE HEAT PIPE#
 00040 MAKING FURNACE EMPLOYING HEAT PIPES FOR PREHEATING GLASS BAT
 00042 R/ TRANSISTOR COOLING BY HEAT PIPES HAVING A WICK OF DIELECT
 00043 DOWN-PUMPING HEAT PIPES#
 00041 FLAT-PLATE HEAT PIPE#
 00042 S HAVING A WICK OF DIELECTRIC POWDER# / COOLING BY HEAT PIPE
 00040 NACE EMPLOYING HEAT PIPES FOR PREHEATING GLASS BATCH# /G FUR
 00043 DOWN-PUMPING HEAT PIPES#
 00038 LING OF AIRBORNE PHASED ARRAY RADAR# HEAT PIPE COO

00044 VITY AND STRUCTURES UTILIZING SAME# /F OPERATING AGAINST GRA
 00044 OPERATING AGAINST GRAVITY AND STRUCTURES UTILIZING SAME# /F
 00046 HEAT TRANSFER DEVICE#
 00039 HEAT TRANSFER PIPE#
 00042 ES HAVING A WICK OF DIELECTR/ TRANSISTOR COOLING BY HEAT PIP
 00044 GAINST GRAVITY AND STRUCTURES UTILIZING SAME# /F OPERATING A
 00037 COMPATABILITY# WATER HEAT PIPE WITH IMPROVED
 00042 OOLING BY HEAT PIPES HAVING A WICK OF DIELECTRIC POWDER# / C
